

Editorial

Greetings from the dynamic World of Laser Dentistry!!!

Lasers in dentistry have been used for more than 2 decades. The long-term results and stability of tissues observed over the years are very encouraging.

It is a major conundrum that there is still a huge lacuna in the area of research with laser dentistry. The truth is that most research is funded by industry and commerce. Unfortunately, because laser companies do not have budgets to support research, the number of studies/clinical and basic research have not been as prolific as it should be. This has also resulted in the dental community being slow to incorporate the new technology in their practice. This is especially true for the erbium laser.

We hope that this cycle can be broken and we could have more long-term research and active users of laser worldwide.

Good Luck!!!
