

Editorial

The penetration of lasers in dental practice has increased quite dramatically in the last few years. Unfortunately, this has not really translated into laser education penetration in the dental community. This cannot be a good trend as the majority of lasers are in the hands of untrained or less trained dentists which create two situations, i.e., dentists either do not use it to its optimal capabilities or they misuse it.

This needs to be corrected by the Dental Council of India, mandating a minimum level of education to allow the use of lasers. I sincerely hope this anomaly will be corrected in the near future.

Good Luck!!!
