

Editorial

Excalibur, King Arthur's mythical sword, "Rose up from out the bosom of the lake" and helped him to multiply his powers. A dental laser is a magical technology that has appeared from the bosom of modern innovation to enhance the dentist's skill. Unlike King Arthur who could use his weapon instantly and required no training, the dentist requires extensive training and experience before mastering the use of any new technology. Access to experience and training is imperative to jump to start the learning curve. This can be achieved and enhanced by scientific knowledge disseminated through unbiased, peer-reviewed journals dedicated to that scientific field.

By collating the work of renowned academicians, researchers and experienced clinicians. The International Journal for Laser Dentistry will provide a common platform for sharing basic science knowledge, treatment protocols and clinical experiences involving dental lasers.

Laser dentistry is still a relatively virgin field with vast unexplored areas that are a delight for scientists and clinicians alike. Researchers, academicians and clinicians have a unique opportunity to share their work and showcase their skills via this journal.

In the final analysis, patient-centric simplification of treatment procedures is the niche that dental lasers proudly occupy. This platform for osmosis of ideas would lead to an improvement of the quality of dental care provided by skilled and knowledgeable dentists.
