

Editorial

Technology affects our lives in a million different ways, most of it being highly beneficial and enriching our day-to-day existence. Dentistry as a field is no exception. We, as practitioners of this artistic science, must be able to adopt newer techniques and technologies to further our knowledge and delivery of the science. The advent of digital dentistry with better imaging techniques, scanners for error-free transfer of data and CAD/CAM milling units and three-dimensional printers has revolutionized and simplified our lives to a great extent. It is our duty as service-providers to embrace these wonderful innovations to make our science as close to exact as possible.

Warm Regards
