3. Copyright

Following guidelines must be followed before submission of the manuscript:

The articles must represent original research material, should not have been published before, and should not be under consideration of publication elsewhere. This however does not include previous publication in form of an abstract or as part of published literature (review or thesis). It is the duty of the author to obtain the necessary permissions for extensive quotations, tables, illustrations, or any other copyrighted material they are using in the paper before a paper can be considered for publication. Copyright of the article gets transferred to Jaypee Brothers, once the article has been accepted for publication. The author would be asked to sign the “Copyright Transfer Form” before his/her article is considered for publication. Once the Copyright Transfer statement has been signed by the corresponding author, no change in authorship or in the order of the authors listed on the article would be accepted by Jaypee Brothers. Also by signing the above mentioned form, the author reassigns the rights of copublishing, or translation if considered necessary in future to the publisher. In the advent of occurrence of any dispute, the matter would be resolved within the jurisdiction of New Delhi court.

While all care has been taken to provide accurate and correct information in accordance with the date of publication, neither the authors, editors nor the publisher takes any legal responsibility for any unintentional omission or error. The publisher makes no express or implied warranty with respect to the information contained herein. The published material cannot be photocopied for the following purposes: general distribution, promotion, new works or resale. If this is required, specific written permission requires to be obtained from the publisher. Exclusive rights to reproduce and distribute the articles in this journal have been protected by copyright. This also covers the rights to reproduce or distribute the article as well as the translation rights. No material published in this journal can be reproduced in digital format or stored in form of electronic databases, video disks, etc.

Both the conflict of interests and financial disclosure needs to be handled well while conducting the research study. Disclosure of such relationships is also important in connection with all articles submitted for publication. Both of these have also been included in the copyright transfer form. Authors should give due acknowledgement to the individuals who provide writing or other assistance while conducting the research study and also disclose the funding source for the research study.

A global solution for dental implantology

axiom®
The new dimension

SIGNIFICANT PRIMARY STABILITY

Progressive threading
- Gradual compression of the bone as the implant is being screwed in.
- Apical threads well-suited to cancellous bone.
- Reduced height of self-tapping vents for more thread caught in the bone tissue.
- Effective in all bone types.

EFFECTIVE ANCHORING IN THE BONE

Asymmetrical threading (pitch: 0.8 mm)
- Optimal exploitation of actual surface area of threading.
- Stress concentration reduced at tip of thread.
- Optimal transformation of occlusal loads into compression forces.
- Promotes bone growth.

Stable connection
- Prosthetic micro-movements totally precluded.
- Periodontal pseudo-attachment maintained.
- Epithelium stabilized over time.

Dual Cone Assembly
- Absence of stress concentration.
- Perfect tightness whatever the working axis of the occlusal loads.
- No unwanted unscrewing of restoration.
- No unexpected rupture of the periodontal integration.

Sealed connection
- Peri-implant sealing.
- No bacterial infiltration.
- Integrity of the biological space respected.

INTUITIVE CONNECTION

Self-guiding connection, depth 3mm
- Unambiguous three-lobed indexation.
- Natural placement of abutment during insertion.
- Shorter prosthetic manipulations.

One connection for all diameters
- Implant diameter and restoration profile totally independent.
- Separate management of bone volume and size of tooth to be restored.
- Less constraints, more flexibility.

Let us begin with two issues, the first is the birth of a new implant journal, which encourages both the seasoned author of implant dentistry as well as beginners to share a common platform to showcase their ideas with the dental fraternity. Such a journal was lacking in this part of the world. The editorial has strived very hard to make this dream a reality.

A journal is made by contributions from authors, so I request the authors to send in their articles, so that they may get a chance to get published in a peer reviewed journal; the only important aspect being originality.

The second issue is communication or rather the lack of it, many a time have I come across doctors who bring in their cases to symposia to share with their seniors and an often seen fact is the dichotomy in which they are placed before reaching a treatment plan, whether to sinus graft along with simultaneous implant placement? Whether to ask his or her orthodontist to create space for the ideal 3-D implant placement, or whether to ask a periodontist to do a connective tissue graft at, before or after implant placement to improve soft tissue profiles. All of this could lead to disastrous results if not planned in the correct way. The list is endless.

Confidence is a virtue and overconfidence is usually a curse. What is lucid is that we all are a victim of whimsical persecutions, we do not want failures in implant dentistry, though when they occur we run helter skelter for help or even worse blame the patient or the materials used. We all want to increase our success and bring down our failure rates.

The main criteria to be kept in mind is that treatment planning an edentulous implant site is a multidisciplinary treatment approach, for which taking the help of colleagues should be considered a learning curve rather than a clash of ideologies. To have a mentor and follow him as a role model is what usually brings out the best treatment outcomes.

In all my travels to various corners of the world for dental implant symposia, despite the fact that there where language barriers, what came across crystal clear was the keenness that doctors all over the world have in learning newer techniques, sharing their viewpoints and striving to provide better treatment to their patients.

So lets shed aside our egos and move forward together hand-in-hand to make dental implant treatment more acceptable to patients and more professionally rewarding for the treatment providers.

Wishing all our readers a great success.

RECENT TECHNICAL ADVANCES

  Alvaro Farnós Visedo, Francisco Benet Iranzo
Overcoming opposites. 
Made by DMG.

Precise implant impressions? Honigum-Heavy is perfectly suited for this task because, thanks to the DMG patented rheologically active matrix, Honigum combines two characteristics which would typically contradict each other: optimal stability and excellent flow characteristics! Thus, Honigum-Heavy flows well around the impression posts or transfer caps and remains dependably at the relevant area. In addition, the material’s high final hardness guarantees a secure fixation of the impression posts and transfer caps thus preventing torsions.

The acclaimed Bränenmark Center recommends Honigum-Heavy specifically for implantology applications. DMG. A smile ahead.

Additional information is available at www.dmg-dental.com
SPI
Spiral implant

The SPI Implant is a conical internal hex implant with a unique combination of design features that enable easy insertion and very high initial stability. The unique shape of the implant body and its variable thread design equip it with some exceptional abilities. It is self drilling, self tapping and self condensing, yielding outstanding advantages in all bone types and in compromised situations. The implant requires only small diameter drilling, resulting in minimal bone loss and reduced trauma.

The spiral implant is therefore the exceptional solution for immediate placement and immediate loading.

...Implants for every indication
